

ABSTRACT OF THE DISCLOSURE

The invention provides an auto file opening system, which is implemented in an electronic apparatus including a storage device for storing a first table and a network connection device. The network connection device connects to a web server, which stores a second table. The auto file opening system according to the invention includes a table search module and a file opening module. The table search module searches the corresponding relationships between the application and the extension from the data stored in the first table and the second table automatically when a user wants to open a file. The file opening module runs the application according to the corresponding relationship between the application and the extension to open the file.
